

Business and Technical Summary

Jargon Software offers mobile software for order entry, route and direct store delivery, field service, inspection, and inventory tracking for small and large companies. Jargon provides the fastest and easiest way to develop and deploy mobile business applications, both connected and disconnected.

Jargon's open design runs on any Windows desktop or WinMobile PDA, smart phone, netbook, notebook, or tablet.

Jargon's award-winning, patented design allows fast development and no deployment overhead. XML pages are used for each screen in the mobile application. Our open standards of XML and JavaScript make Jargon applications highly flexible and configurable to meet the exact needs of any customer.

Jargon Software offers a unique thin client approach applied to mobility, with mobile applications much like web pages, with screens stored as XML pages.

Our deployment engine incorporates a high volume SQL database to power simple store and forward requirements as well as complete solutions with all data needed locally. Our deployment engine works with all HTTP compliant middleware as well as FTP services. Jargon Software looks forward to discussing any application or implementation idea.
