FOR IMMEDIATE RELEASE:

## A New Market Segment for Jargon Software

**Minneapolis, MN, January 23, 2007** – Jargon Software announced today that SI Systems has adopted Jargon mobile software for remote field service time-and-materials-collection to augment their back-office offering.

As a reseller, SI Systems will be using Jargon's mobile development and deployment technology as an integrated part of their backend solution. SI Systems will deploy the new mobile product within two months, resulting in their customers' ability to sell more products and provide improved customer service for greater customer loyalty and satisfaction. This is needed in the current era of intense competition to speed order processing, increase cycle times, and thereby improve cash flows.

SI Systems provides complete job costing and integrated accounting solutions for mid- to larger- sized sub- and specialty contractors and fire-suppression companies. Adding these PDA features to SI's extensive service tracking, scheduling and routing functions extends the application into the field and is a natural way to ensure that fire-suppression inspections are always up to date.

Jargon Software designs mobile products that integrate sales-order processing, inventory, field service, and inspections for small and large companies in any industry anywhere in the world...the fastest and easiest way to develop and deploy connected or disconnected mobile business applications.

The open Jargon design makes it possible to manage business on any PDA, including the newest mobile devices not yet imagined, resulting in a significant advantage in speed to market.

Our customers are dispersed among completely diverse market segments, from fine jewelry manufacturers to specialty foods producers to construction materials manufacturers to recreation and healthcare management.
